[ABSTRACT]

In a method and system for printing computer generated images a multiple-page sheet is prepared for printing on a printing engine, starting from an input of pages in page description language (PDL) files for each page of a multiple-page sheet and having an output in a bitmap format for the multiple-page sheet. The method includes an imposition method step, the system an imposition module or impositioner. Prior to imposition, each of the page description language (PDL) files of the pages to be combined on the multiple-page single sheet are, in a rendering method step, renderer or rendering module, rendered into bitmaps or pixelmaps, wherein the rendering method step encompasses imposition related operations in dependency on imposition parameters. Thereafter imposition of the bitmap files into a sheet bitmap file is performed.
